

Amendments to the Claims

Please amend the claims as shown below in the complete listing of claims.

1. (Previously Presented) A vehicular mirror assembly for providing an occupant of a vehicle with a rearward view, the mirror assembly comprising:
a reflective element having a first pivot element and a first actuator element;
a frame for supporting the reflective element having a second pivot element and a second actuator element, the first and second pivot elements being adapted to be interconnected to one another to tiltablely mount the reflective element to the frame and the first and second actuator elements being adapted to be interconnected to one another whereby actuation of the second actuator element causes the reflective element to tilt with respect to the frame;
at least one of the first pivot element, the second pivot element, the first actuator element and the second actuator element being movably mounted to a respective one of the reflective element and the frame so that one of the frame and the reflective element is employed with differently-sized corresponding ones of other reflective elements and frames.
2. (Previously Presented) A vehicular mirror assembly according to claim 1, wherein the at least one first pivot element comprises one of a ball and socket.
3. (Previously Presented) A vehicular mirror assembly according to claim 2, wherein the at least one second pivot element comprises the other of a ball and socket.
4. (Previously Presented) A vehicular mirror assembly according to claim 1, wherein the frame further comprises a slot, the at least one second pivot element further comprises a plate, and the plate is slidably received in the slot so that it is movable between a plurality of positions to alter the distance between the interconnected first and second pivot elements and the interconnected first and second actuator elements.

5. (Previously Presented) A vehicular mirror assembly according to claim 1, wherein the second actuator element comprises an actuator assembly having at least one moveable jackscrew for adjusting the tilt of the reflective element, wherein the at least one first actuator element is attached to the actuator assembly.

6. (Previously Presented) A vehicular mirror assembly according to claim 5, wherein the at least one second actuator element comprises two second actuator elements.

7. (Previously Presented) A vehicular mirror assembly according to claim 6, wherein the two second actuator elements comprise the jackscrews.

8. (Previously Presented) A vehicular mirror assembly having a reflective element for providing an occupant of a vehicle with a rearward view and an actuator assembly having at least one moveable jackscrew for adjusting the tilt of the reflective element, the mirror assembly comprising:

- a frame supporting the actuator assembly;
- one of a ball and socket attached to the reflective element;
- the other of a ball and socket attached to the frame to form a pivotable connection with the one of a ball and socket for connecting the reflective element to the frame; and
- the at least one jackscrew is attached to the reflective element at a location spaced from the one of the ball and socket for connecting the reflective element to the actuator assembly, wherein actuation of the jackscrew assembly causes the reflective element to tilt relative to the frame;

wherein a first reflective element is attached to the frame by selectively moving the one of the ball and socket along the frame to a first position in order to engage the other of the ball and socket; and

wherein a second reflective element is attached to the frame, when the first reflective element is disconnected therefrom, by selectively moving the one of the ball and socket along

the frame to a second position in order to engage the other of the ball and socket, thereby enabling the frame to be alternatively attached to reflective elements having the other of the ball and socket in alternatively different locations.

9. (Previously Presented) A vehicular mirror assembly according to claim 8, wherein the frame further comprises a slot, the one of the ball and socket further comprises a plate, and the plate is slidably received in the slot.

10. (Previously Presented) A vehicular mirror assembly according to claim 8, wherein the reflective element further comprises a slot, and the at least one moveable jackscrew is slidably received in the slot.

11-14. (Cancelled without prejudice)
